BIBLIOGRAPHY

A. Stability of Crowding and Rotation Corrections

• Various principles of increased stability from early-intervention.

- 1. Reitan, K., Tissue Rearrangement During Retention of Orthodontically Rotated Teeth, *Angle Orthod.*, 29: 105-113, 1959. Recommended early treatment, at least before root apex development is complete to prevent relapse of rotations.
- 2. Reitan, K., Tissue Behavior During Orthodontic Tooth Movement, Am. J. Ortho., 46: 881-900, 1960. Same as above.
- 3. Sanin, C., and Savara, B.S., Factors That Affect the Alignment of the Mandibular Incisors: A Longitudinal Study, *Am. J. Ortho.*, 64: 248-249, 1973.
- 82% of straight incisors at 8 years of age were straight at 14, while 89% of crowded incisors at 8 years were crowded at 14. 4. Grosfeld, O., Longitudinal Observations of the Development of Occlusion in Children After Orthodontic Treatment in the
- Deciduous Dentition, *Tr. Europ. Ortho. Soc.*, 49th Congr., 251-258, 1973. In treating with functional appliances before 6 years of age, 12.3% had relapse and 26.1% had other complications seen 4 years after completion of permanent dentition in 65 children.
- 5. Gallerno, R.L., *Mandibular Anterior Crowding: A Postretention Study*, M.S.D. Thesis, Univ. of Washington, Seattle, 1976. Treating at an early age reduces relapse of incisal crowding in 83 cases.
- Corruccini, R.S. and Potter, R.H.Y., Genetic Analysis of Occlusal Variation in Twins, *Am. J. Ortho.*,78: 140-154, 1980. Molar relations, overjet, overbite, rotations and crowding are 90% influenced by environment and only 10% by genetics.
- 7. Harris, E.F. and Smith, R.J., A Study of Occlusion and Arch Widths in Juveniles, *Am. J. Ortho.*, 78: 155-163, 1980. Shows same result as seen in Corruccini and Potter (#6, above).
- Schwartz, M. from Lewis, S.J. and Lehman, I.A., A Quantitative Study of the Relation Between Certain Factors in the Development of the Dental Arch and the Occlusion of the Teeth, *Int. J. Orthod., Oral Surg. and Radiol.*, 18:1015-1037, 1937. Rotations of permanent incisors can be seen radiographically at 2 years of age and won't usually erupt straight.
- The following 6 studies (#9 #14) substantiate arch enlargement as a result of incisors erupting without rotations or displacement.
- 9. Lewis, S.J. and Lehman, I.A., A Quantitative Study of the Relation Betwen Certain Factors in the Development of the Dental Arch and the Occlusion of the Teeth, *Int. J. Orthod., Oral Surg. and Radiol.*, 18: 1015-1037, 1932. Eruption of lower permanent incisors have (38%) less arch enlargement when these teeth erupt crowded (2.13 mm.) as when they erupt straight (3.44 mm.) or a mean difference of 1.31 mm. in the canine-to-canine arch increase.
- Lewis, S.J. and Lehman, I.A., Observations on Growth Changes of the Teeth and Dental Arches, *Dent. Cosmos*, 71: 480-499, 1929. Incisal crowded cases have 2.13 mm. canine-to-canine enlargement while uncrowded cases have 3.44 mm. expansion.
- 11. Korkhaus, G. and Neumann, F., Das Kieferwachstum wahrend des Schneidezahnwechsels und die orthodontische Fruhdehnung, *Fortschr. Ortho.*, 1: 32-62, 1931.
- Baume, L.J., Physiological Tooth Migration and its Significance for the Development of Occlusion. I. The biogenetic course of the deciduous dentition. II. The biogenesis of accessional dentition. III. The biogenesis of the successional dentition. IV. The biogenesis of overbite, *J. Dent. Res.*, 29: 123-132, 331-337, 338-348, 440-447, 1950. If permanent incisor does not erupt into arch, there is no increase in arch dimension. If lower incisors come directly into arch without rotations, the arch dimension can be increased as much as 5 mm. (upper, 6.5 mm.). Mean enlargement was 2.3 mm.. Spaced deciduous incisors result in 10% less arch enlargement as the permanent incisors erupt than deciduous incisors without spaces.
- 13. Korkhaus, G. and Neumann, F., 1931.
- Deciduous incisors that have interproximal spacing have 20% less arch enlargement than deciduous teeth without spaces. 14. Lewis, S.J., Some Aspects of Dental Arch Growth, *J. Am. Dent. Assoc.*, 23: 277-294, 1936.
- In a case with a missing lower permanent lateral, there was no change in deciduous arch size, while upper arch in same case with all incisors present had normal upper arch enlargement.
- Crowded adult dentitions have narrower arches (lower canine-to-canine is 3 mm. smaller) than well-aligned arches (tooth sizes being the same), #15 #17:
- 15. Mills, L.F., Arch Width, Arch Length and Tooth Size in Young Adult Males, Angle Ortho., 34: 124-129, 1964
- 16. Howes, A.E., Arch Width in the Premolar Region Still the Major Problem in Orthodontics, Am. J. Ortho., 43: 5-31, 1957.
- Howe, R.P., McNamara, J.A., Jr. and O'Connor, K.A., An Examination of Dental Crowding and its Relationship to Tooth Size and Arch Dimension, *Am. J. Ortho.*, 83: 363-373, 1983.
- Relation of crowding and spacing between deciduous and permanent incisal dentitions.
- 18. Leighton, B.C., 1969.

Crowded deciduous incisors	100% chance of permanent incisal crowding
No spaces deciduous incisors	67% chance of permanent incisal crowding
Less than 3 mm. spaces deciduous incisors	50% chance of permanent incisal crowding
3 - 6 mm. spaces deciduous incisors	20% chance of permanent incisal crowding

Over 6 mm. spaces deciduous incisors

- Barrow, G.V. and White, J.R., Developmental Changes of the Maxillary and Mandibular Dental Arches, *Angle Orthod.*, 22: 41 - 46, 1952. If no spaces of deciduous lower incisors - 69% had permanent crowding. 37% had increase in mandibular crowding 6 to 14 years of age. 24% had increase in maxillary crowding 6 to 14 years of age.
- 20. Neumann, D., Weitere Untersuchungen uber die Gibissentwicklung an Hand von Reihenuntersuchungen bei Kindern in 10 Lebensjahr, *Deutsch Zahn.-Mund-und Kieferhelk*, 22: 157-165, 1955.
 - If no spaces between deciduous upper incisors 77.8% got crowding of permanent incisors.
- 21. Baume, L.J., 1950. If no spaces between lower deciduous incisors 43% got crowding of permanent incisors.
- 22. Heckman, U., A Longitudinal Study of Dental Development in 82 Children from Birth to 12 Years of Age, *Trans.Europ. Ortho. Soc.*, 49th Congr., 259-265, 1973. Crowding did not improve from 6 to 12 years of age.
- Sillman, J.H., Clinical Considerations of Occlusion, *Am. J. Ortho.*, 42: 658-682, 1956.
 75% of poor occlusions in permanent dentitions had poor deciduous dentitions. 89% of good occlusions in permanent dentitions had good deciduous dentitions.
- 24. Moorrees, C.F.A., *The dentition of the growing child*, Harvard University Press, Cambridge, Mass., 1959 Can predict adult crowding from available space at 5 years of age.
- Studies Substantiating Arch Enlargement as a Result of Incisors Erupting without Rotations (#26 #30):
- 25. Korkhaus, G. and Neumann, F., 1931.
- 26. Baume, L.J., 1950.
- 27. Howes, A.E., 1957.
- 28. Mills, L.F., 1964.
- 29. Howe, R.P., McNamara, Jr., J.A., and O'Connor, K.A., 1983.

• Deciduous Crowding Incidence:

- 30. 10.6% Seipel, C.M., Variation in Tooth Position, Svensk Tandlakare-Tidschr., Vol. 39, Suppl., 1946.
- 31. 14.0% Barrow, G.V. and White, J.R. 1952.
- 32. 3.7% Heckman, U., 1973.

• Permanent Crowding Incidence:

- 33. 67% Sodermans, H., Uber den Ablauf der Gebissentwicklung bei Kompressionsanomalien, *Deutsche Zahn-Mund. und Kieferheilk.*, 6: 194-206, 422-439, 1939.
- 34. 61% Seipel, C.M. 1946.
- 35. 51% Barrow, G.V., and White, J.R., 1952.
- 36. 75.8% Cryer, B.S., Lower Arch Changes During the Early Teens, Trans. Europ. Orthod. Soc., 41st Congr., 87-99, 1965.

37. 79.6% Haynes, S., The Prevalence of Malocclusion in English Children Aged 11 - 12 years, *Trans Europ. Ortho. Soc.*, 46th Congr., 89-98, 1970.

- 38. 28.0% Heckman, U., 1973.
- Arch Enlargement During Incisor Eruption Lower Arch Increases During the Eruption of Lower Permanent Incisors (#40 #44):

B. Stability of Overbite and Overjet

• Principles of overbite and overjet and its relation to growth:

- 69. Simons, M.E. and Joondeph, D.R., Change in Overbite: A Ten Year Postretention Study, Am. J. Ortho., 64: 349-367, 1973. Showed that vertical jaw growth has significant influence on success of long-time overbite stability following orthodontic treatment.
- 70. Methenitou, S., Shein, B., Remanathan, G. and Bergersen, E.O., The Prevention of Overbite and Overjet Development in the 3 to 8 Year Old by Nighttime Guidance of Incisal Eruption: A Study of 43 Individuals, J. Clin. Pediat. Dent., 14: 219-230, 1990.

Showed a significant relation between overjet at $2\frac{1}{2}$ years of age and overbite at 18 years of age in the same untreated individuals. Can prevent overbite from developing by retarding the overeruption of the maxillary permanent incisors.

- 71. Miura, F. and Ito, G., Eruptive Force of Rabbit's upper Incisors, Trans. Europ. Orthod. Soc., 44th Congr., 121-126, 1968. 7 grams of force was sufficient to stop the eruption of rabbit incisors.
- 72. Woodside, D.G., Metaxas, A. and Altuna, G., The Influence of Functional Appliance Therapy on Glenoid Fossa Remodeling, Am. J. Ortho., 92:181-198, 1987. Glenoid Fossa remodeled forward in growing monkeys as result of functional treatment and in adult monkeys as well. Growth of condyle only in growing monkeys.

Overbite increases about 2 mm. from the primary to the mixed dentition (#74 - #77):

- 73. 1.75 mm. N=51 Barrow, G.V. and White, J.R., 1952.
- 74. 1.64 mm. N=70-91 Moorrees, C.F.A., 1959.
- 75. 2.35 mm. Moyers, R.E., van der Linden, F.P.G.M., Riolo, M.L. and McNamara, J.A., Jr., Standards of N-38-81 Human Occlusal Development, Center for Human Growth & Development, Univ. of Michigan, Ann Arbor, 1976.
- 76. 1.75 mm. N=43 Methenitou, S., Shein, B., Ramanathan, G. and Bergersen, E.O., 1990.

Overbite remains constant from 8 years to adulthood (#78 - #86):

- 77. Linder, J., Bimetrische Untersuchunger des Normalgebisses in Verschiedenen Lebansaltern. Intermaxillare und Dentofaciale Beziehungen, Inaug. Dissertation, Rheinischen Friedrich-Wilhelms-Universitat, Bonn, Germany, 1930.
- 78. Baurle, J.R., A Longitudinal Study of Incisor Overbite from Mixed Deciduous Dentition to Age Fifteen, M. S. Thesis, Univ. of Iowa, Iowa City, IA, 1949.
- 79. Baume, L.J. 1950.
- 80. Moorrees, C.F.A., The Dentition of the Growing Child, 1959.
- 81. Fleming, H.B., An Investigation of the Vertical Overbite During the Eruption of the Permanent Dentition, Angle Ortho., 31: 53-62, 1961.
- 82. Frohlich, F.J., A Longitudinal Study of Untreated Class II Type Malocclusions, Tr. Europ. Ortho. Soc., 37th Congr. 137-151, 1961.
- 83. Leighton, B.C., The Early Development of Normal Occlusion, Tr. Europ. Ortho. Soc., 51st Congr., 67-77, 1975.
- 84. Moyers, R.E., et.al., Univ. of Michigan, Ann Arbor, Michigan, 1976.
- 85. Bergersen, E.O., A Longitudinal Study of Anterior Vertical Overbite from Eight to Twenty Years of Age, Angle Ortho., 58: 237-256, 1988.

Relapse tendencies of overbite and overjet:

86. Hasegawa, M., The Roentgenographic Study of the Relapse Behavior of Overjet and Overbite and it's Factors, J. Jpn. Ortho. Soc., 42: 1-23, 1983. Overjet relapsed 25% and overbite 71.5% in 53 cases 10 years out of retention.

Incidence and severity of overbite and overjet:

87. Luffingham, J.K. and Campbell, H.M., The Need for Orthodontic Treatment, A Pilot Survey of 14 Year Old School Children in Paisley, Scotland, Tr. Europ. Ortho. Soc., 50th Congr.: 259-267, 1974.

76% of overbites were 3 mm. or more, and 68% of overjets were 3 mm. or more.

- **Overjet Remains the Same From the Primary to Permanent Dentition (#89 #91):**
- 88. Moorrees, C.F.A., The Dentition of the Growing Child, 1959.
- 89. Leighton, B.C., The Early Signs of Malocclusion, Tr. Europ. Ortho. Soc., 45th Congr., 353-368, 1969.
- 90. Foster, T.D. and Grundy, M.C., Occlusal Changes from Primary to Permanent Dentition, Brit. J. Ortho., 13: 187-193, 1986. **Molar Relations:**

91. Silver, E.I., Forsyth Orthodontic Survey of Untreated Cases, Am. J. Ortho. and Oral Surg., 30: 635-659, 1944.

80% of Class I occlusions did not improve from deciduous to permanent dentitions.

- 76% of Class II occlusions increased severity from deciduous to permanent dentitions.
- 89% of Class III occlusions increased severity from deciduous to permanent dentitions.
- 92. Leighton, B.C., 1969. Antero-posterior relation is constant from deciduous to permanent dentitions.
- 93. Foster, T.D. and Grundy, M.C., 1986. Antero-posterior relation is constant from deciduous to permanent dentitions.

94. Haynes, S., 1970.

At 11-12 years of age, 73.1% had malocclusions.

50.7% had Class I malocclusions.

19.6% had Class II malocclusions.

2.55% had Class III malocclusions.

0.76% were unclassifiable.

95. Sillman, J.H., Development of Occlusions: A Serial Study from Birth to Seven Years, *J. Second Dist., Dent. Soc.*, 31: 153-163, 1945. At 20 months of age when the 1st deciduous molar (upper and lower) erupt, the prognosis of a malocclusion can be made and the outcome of the molar relation is predictable.

C. Prevents TMJ Problems:

- 96. Bergersen, E.O., Preventive and interceptive orthodontics in the mixed dentition with the myofunctional eruption guidance appliance: Correction of crowding, spacing, rotations, crossbites and TMJ, *J. Pedodont.*, 12:386-414, 1988.
- 97. Solberg, W.K., Bibb, C.A., Nordstrom, D.B. and Hansson, T.L., Malocclusion Associated with Temporomandibular Joint Changes in Young Adults at Antopsy, *Am. J. Ortho*, 89: 328-330, 1986.

Overbite and overjet is associated with disk damage and damage increases with exposure (age).

- 98. Riolo, M.L., Brandt, D. and TenHave, T.R., Associations Between Occlusal Characteristics and Signs and Symptoms of TMJ Dysfunction in Children and Young Adults, *Am. J. Ortho.*, 92: 467-477, 1987. Almost all malocclusions associated with TMJ problems and increases with age.
- 29. Lieberman, M.A., Gazit, E., Fuchs, C., and Lilos, P., Mandibular Dysfunction in 10 to 18 Year Old School Children as Related to Morphological Malocclusion, *J. Oral Rehabil.*, 12: 209-214, 1985.

Abnormal overbites and occlusal wear are related to joint problems in 369 children.

• I	ncidence of	TMJ Clicking So	ounds (#109 - #111):

- 108. 5% 3-5 yrs of age Bernal, M. and Tsantsouris, A., 1986.
- 109. 10% 6-8 yrs of age Grosfeld, O. and Czarnecka, B., 1977.
- 110. 20% 13-15 yrs of age Grosfeld, O. and Czarnecka, B., 1977.

• Importance of early detection of TMJ problems:

111. Sanchez-Woodworth, R.E., Katzberg, R.W., Tallents, R.H. and Guay, J.A., Radiographic assessment of temporomandibular joint pain and dysfunction in the pediatric age group, *J. Dent. for Childr.*, 55:278-281, 1988. In children (N=150) from 7 to 16 years of age with TMJ problems 37% had degenerative arthritis and 46% had meniscal displacement without reduction.

D. Converts Difficult Cases and Gummy Smiles:

- 112. Bergersen, E.O., Preventative Eruption Guidance in the 5 to 7 Year Old, *J. Clin. Ortho.*, 29: 382-395, 1995. Shows the finished results of potentially compromised deciduous dentitions.
- 113. Hulsey, C.M., An Esthetic Evaluation of Lip-Teeth Relationships Present in the Smile, *Am. J. Ortho.*, 57: 132-144, 1970. Indicated the most pleasing position for the teeth in a smile and frequency of gummy smiles in adults was 22.5%.
- 114. Peck, S., Peck, L., and Kataja, M., The Gingival Smile Line, *Angle Ortho.*, 62: 91-100, 1992. Indicated frequency and causes of gummy smiles, mainly overjet, overbite, increase palatal line to incisal edge distance, and greater adtivity of muscular elevation of the upper lip.
- 115. Peck, S., Peck, L. and Kataja, M., Some Vertical Lineaments of Lip Position, Am. J. Ortho., 101: 519-524, 1992. Indicated 41% have at least 1 mm. of gum tissue exposed during a high smile with females having twice the incidence as males (54% vs. 26%).

E. Gingival Tissue and Other Effects:

116. Poulton, D.R. and Aaronson, S.A., Relationship Between Occlusion and Periodontal Status, Am. J. Ortho., 47: 690-699, 1961. Showed significant correlation with overbite, lower incisal crowding, overjet and lack of posterior intercuspation to periodontal status, pocket depth, gingivitis and looseness of teeth.

- 117. Kalamkarova, S. Kh., Stomotologia (Mosk) 1986 65 (2) 76-78, Engl. Abstr. Deep bites are associated with periodontal disease, bone tissue resorption with looseness and loss of teeth in 142 patients.
- 118. Ramfjord, S.P. and Major, M.A., Jr., Significance of Occlusion in the Etiology and Treatment of Early, Moderate, and Advanced Periodontitis, J. Period., 52: 511-517, 1981. Mouth breathing and severe protrusion of teeth causes periodontal problems.
- 119. Waerhang, J., Eruption of Teeth into Crowded Position, Loss of Attachment, and Downgrowth of Subgingival Plaque, Am. J. Ortho., 78: 453-459, 1980. Found downgrowth of subgingival plaque on erupting crowded teeth.
- 120. Sandoli, T., Irregularities of the Teeth and Their Relation to the Periodontal Condition with Particular Reference to the Lower Labial Segment, Tr. Eruop. Ortho. Soc., 49th Congr., 319-333, 1973. Irregularity and crowding of lower incisors is associated with loss of gingival tissue.
- 121. Sharpe, W., Relationship of Relapse to Apical Root Resorption and Alveolar Crestal Bone Levels, Am. J. Ortho., 88: 526, 1985. Cases with lower anterior crowding relapse have greater root resorption and lower alveolar crestal bone.
- 122. Dermant, L.R. and DeMunck, A., Apical Root Resorption of Upper Incisors Caused by Intrusive Tooth Movement: A Radiographic Study, Am. J. Ortho., 90: 321-326, 1986. Intrusion caused root resorption of 18% with 3.6 mm. of intrusion and 2.5 mm. resorption.
- 123. El-Mangoury, N.H., Gaafar, S.M. and Mostafa, Y., A., Mandibular Anterior Crowding and Periodontal Disease, Angle Ortho., 57: 33-38, 1987. Plaque and gingival problems greater in crowded cases and returns faster after curettage.
- 124. Artun, J. and Krogstad, O., Periodontal Status of Mandibular Incisors Following Excessive Proclination, Am. J. Ortho., 91: 225-232, 1987.
 - The thinness of the mandibular symphisis is correlated with an increase in clinical crown height with gingival recession.
- 125. Kennedy, D.B., Joondeph, D.R., Osterberg, S.K. and Little, R.M., The Effect of Extraction and Orthodontic Treatment on Dentoalveolar Support, Am. J. Ortho., 84: 183-190, 1983.
- Teeth displaced during eruption had more long-term proximal bone loss than normal erupting teeth.
- 126. Position Paper of American Academy of Periodontology, Periodontal Diseases of Children and Adolescents, J. Periodont., 67: 57-62, 1966. Children 5-11 years have up to 9% loss of periodontal attachment and bone support; 12-15 years have up to 46%. Generalized juvenile periodontis, consisting of marked inflamation and heavy plaque and calculus, begins at or around puberty.

127. Tala, H., Community Periodontal Index of Treatment Needs in Finland, Int. D. J., 37: 179-182, 1987. (CIPTN) from Ainamo - 6 sextants are measured and there are 6 categories, namely, supragingival calculus, subgingival calculus, pocket 4 to 5 mm., pocket of 6+ mm., bleeding after probing, recession (now eliminated). 43% of 7 year olds had healthy gingival tissue and, rather consistantly dropped so that by 12 years only 27% had healthy tissues.

- A philosophy of early open-bite corrections and the natural retraining of the tongue during swallowing 6-10 years of age is optimum time for language learning with gradual decline in correct pronunciation:
- 128. Ramsay, C. and Wright, E., J. Soc. Psych., 94:115-121, 1974.
- 129. Payne, A., Locating Language in Time and Space, Acad. Press, N.Y. 1980.
- 130. Tahta, S., Wood, M. and Loewenthal, K., Lang. & Speech, 24:265-272, 1981.
- 131. Newport, E., Papers Reports Child Lang. Dev., 23: 1-23, 1984.
- 132. Long, M., Masturational Contstraints on Language Development, Univ. of Hawaii, 1987.
- Language skills learned 4-10 years of age when cerebum is plastic and receptive:
- 133. Pennfield, W., The Second Career, Little Brown, Boston, 1963.
- Development of foreign accents at 10 years of age when cerebral neuroplasticity is lost:
- 134. Lenneberg, E., Biological Foundations of Language, Wiley, NY, 1967.
- Root Resorption:
- 135. Reitan, K., Tissue Behavior During Orthodontic Tooth Movement, Am. J. Ortho. 46: 881-900, 1960.
- Early treatment before root fully formed may prevent relapse due to formation of fibers after the teeth are straightened. 136. Reitan, K., Tissue Rearrangement During Retention of Orthodontically Rotated Teeth, Angle, Ortho., 29: 105-113, 1959.,
- Early treatment before root formed would solve relapse because of fiber development after straightening. Fibers around root rearrange first after 28 days, marginal fibers takes longer than 7.5 months.
- 137. Reitan, K., Initial Tissue Behavior During Special Root Resorption, Angle Ortho., 44: 68-82, 1974. Cementoid delays root resorption. Uncalcified predentin is not attacked by resorbing cells, therefore treatment before root is fully developed can prevent resorption.
- 138. Linge, B.O., and Linge, L., Apical Root Resorption in Upper Anterior Teeth, Europ. J. Ortho., 5: 173-183, 1983. Treating at earlier ages with incomplete root formation reduces risk of root resorption. Functional appliances had half of the resorption that fixed appliances had. Especially risky are Class II elastics, edgewise fixed appliances and pre-treatment signs of resorption.
- 139. Stenvak, A., Pulp and Dentine Reactions to Experimental Tooth Intrusion, Tr. Eruop. Ortho. Soc., 45th Congr., 449-464,

1969. Depressing mature teeth causes scar tissue to form and does not completely repair itself if root end is mature. Roots with open apical foramen did not experience damage and recuperated rapidly.

- 140 Linge, L. and Linge, B.O., Patient Characteristics and Treatment Variables Associated with Apical Root Resorption During Orthodontic Treatment, Am. J. Ortho., 99: 35-43, 1991. Activators don't cause root resorption. Risk of root resorption lessened whenever fixed phase is reduced with little use of Class II elastics and reduced use of fixed appliances and heavy wires.
- 141. Rosenberg, M.N., An Evaluation of the Incidence and Amount of Apical Root Resorption and Delaceration Occurring in Orthodontically Treated Teeth Having Incompletely Formed Roots at the Beginning of Begg Treatment, *Am. J. Ortho.*, 61: 524-525, 1972. Teeth with incomplete root ends will develop normal roots when active orthodontics is done and will have less root resorption when compared to teeth with completely formed roots.

• Tooth Correlations:

- 142. Hixon, E.H. and Oldfather, R.E.,
 - Relations of lower permanent incisors to posteriors (canine, premolars) r = 0.69.
- Bergersen, E.O., The Preformed Orthodontic Positioner and Eruption Guidance Appliance, Northwestern Univ., Chicago, IL, 1981.

Relation of maxillary adult anterior and posterior vs. mandibular anterior and posterior r= 0.86.

Relation of maxillary anteriors vs. mandibular posteriors	r=0.80
Relation of maxillary posteriors vs. mandibular posteriors	r=0.80
Relation of mandibular anteriors vs. mandibular posteriors	r=0.64
Relation of maxillary anteriors vs. maxillary posteriors	r=0.61

Bolton, W.A., Disharmony in Tooth Size and its Relation to the Analysis and Treatment of Malocclusion, *Angle Ortho.*, 28: 113-130, 1958.

Relation upper 1st premolar vs. lower 1st premolar	r=0.96
Relation upper 2nd premolar vs. lower 2nd premolar	r=0.5
Relation upper 1st premolar vs. lower 1st premolar	r=0.61
Relation lower incisors vs. lower canine, premolars	r=0.65

- 145. Moorrees, C.F.A., 1959. Relation between deciduous and permanent teeth are relatiavely low ranging for incisors of r=0.23 to r=0.41, not high enough for any significant predictions.
- 146. Pettenella, L. and Menini, G., The Relationship Between the Transverse Diameters of Face, Upper Arch and Teeth, *Tr. Eruop. Ortho. Soc.*, 39th Congr., 281-284, 1963. Mesio-distal width of upper incisors vs. canine-to-canine width r=0.95.

• Miscellaneous Principles:

147. Atkinson, S.R., Jaws Out of Balance, Part 1, Am. J. Ortho., 52: 47-55, 1966.

Teeth can be stopped in erupting and root ends will continue to normally develop. If tooth moved before root ends are completely developed, it will obtain normal root length, but might be bent toward the direction of the movement.

- 148. Skrogsborg, C., The Permanent Retention of the Teeth After Orthodontic Treastment, *Dsent. Cosmos.*, 39: 1117-1129, 1927. Recommended cutting the collagenous fibers to improve the retention of corrected rotations.
- 149. Edwards, J.G., A Surgical Procedure to Eliminate Rotational Relapse, *Am. J. Ortho.*, 57: 35-46, 1970. Recommended cutting the collagenous fibers to improve the retention of corrected rotations.
